"Enpresa honek laguntza bat jaso du, erdi bana (%50) finantzatu dutena Nafarroako Gobernuak eta Eskualde Garapeneko Europako Funtsak, Nafarroako EGEF 2014-2020 Programa Eragilearen bidez".

DUAL ACTION

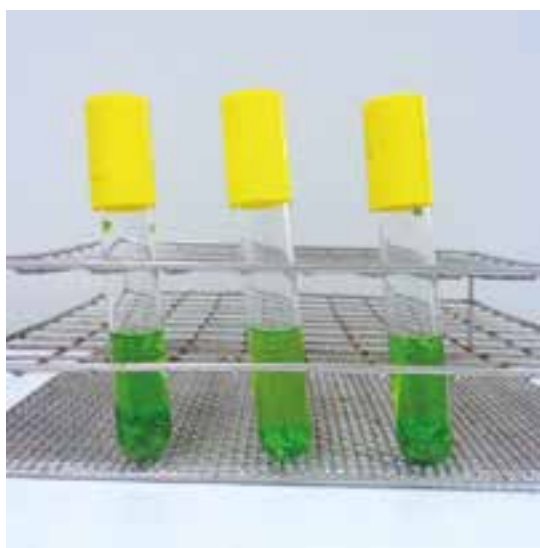

Products based on natural extracts with antifungal and biofertiliser properties

DUAL ACTION

This project seeks to develop a line of products based on natural extracts with antifungal and biofertiliser properties.

The project opens up a new line of product development based on lipophilic active ingredients obtained from different types of plant for the development of a range of products with a DUAL effect: as a biofertiliser and a biofungicide.

FITOGRASS

Some plants have a high content of lipophilic substances. This type of substances may be located in all the walls of the plant cuticles. Work involves selecting families of plants with a high content of lipophilic active ingredients to define extraction methods and identify and concentrate these active ingredients for the development of a range of products for their agricultural use, which is the main goal of this project.

This product range will meet two clear goals:

- Unique and new products in the market.
- Safe products, presenting a low risk of toxicity in their handling for both crops and the dispenser: the farmer.
